Mobile Electroneum mining

Electroneum

About

Electroneum is a crypto that is focussing on the mobile platform. Easy to use and accessible for everyone

Official website

Main characteristic
- Secure and private
- Designed for mass adoption
- App based mobile mining
- Signed agreements with global mobile networks
- Provide a digital payment solution to the developing world.

Wallet

As Electroneum is focusing on becoming the best mobile crypto they have an online wallet with mobile apps.
Wallet page

Mining Pool

 I'm using spacepools to mine electroneum
The official pool has a 0.1 % fee and has a payout of 10 ETN which is pretty low for both.
When selecting a mining pool when mining with a mobile device with a low hashrate it is important to take a pool with a low payout.
You won't be generating a lot of coins over a short amount of time so you want to be able to get your mined coins on a higher frequency, keep in mind if you stop mining before the minimum payout has reached they won't give you your mined coins.
Also try to pick a pool closeby (continent), this will also help with mining.
You can always visit the website of your pool and insert your address to look at the progress you are making showing your statistics.

Tools

NeoNeonMiner (Android)

After trying out a couple of apps, most of them seemed to either not mine or be a scam.
However I've used this app for a while and it did seem to work pretty fine and pretty simple to use.
Another advantage is that the app can run in the background so you can still use your phone and use it other things while it is running.
The app required android 2.3 and up so all recent devices will be able to run this.

Instructions

Risks

Before mining please make sure you are aware of the risks involved.

- Download and install the NeoNeonMiner from the google play store
- You can find the link at the tools section.
- Open the app and swipe left once to open the settings page
- Select the preset you'd like to use
  If it is the first time using the app it will most likely be preset 1.
  You can set up different miners on other presets.

- Enter the address and port of the pool you want to use
  You can usually find this under a getting started tab on the website of the pool.

- Select the correct protocols to mine
  Select the "stratum+tcp" internet protocol and "cryptonight" as Mining protocol

Click to copy

Give this wallet address to the person sending you Electroneum. They can send you
Electroneum via the app or from Windows, Mac or Linux Wallets.

It's perfectly safe to give the address. You can even publish it on your website or social media.

- Set the password correctly
  For most pools this is just "x".
  You'll need to check what information your pool is giving you.
- Press the store button
  Make sure to press this button or all your settings will be lost!

- Swipe right and press start to mine
- After you've pressed start you'll see text appearing in the bottom cell.
  The first time it will always post 0.0 H/s but after a few seconds it will post at which hashrate it is going
- Now you just have to let the device do its calculations and you will slowly start gaining Electroneum
