NiceHash mining

NiceHash

About

NiceHash is a largest crypto-mining marketplace that connects sellers or miners of hashing power with buyers of hashing power. It offers convenient and easy-to-use tools for each group to create as much profit as possible.
The idea here is different to the other miners. You sell your hashing power to a buyer and the buyer then pays you. Meaning you mine crypto for someone else and get a payment for doing so
The idea is good and it is probably together with Minergate the easiest way to mine, but they aren't as profitable as just mining the crypto's yourself.
So if you don't mind putting in a little bit more effort I suggest to mine with real mining tools and mine it like that.

Written Instructions

Risks

Before mining please make sure you are aware of the risks involved.
Risks
NiceHash has an additional risk, as the miner is seen as a virus to most antivirus you might have to switch off your antivirus or set an exception for excavator.exe

Registration

- Go to the registration page and fill in your email and the preferred password, then check the kaptcha and agree with the terms.

Already have an account?   Got a verification code?

- Now you'll get a verification email, you can either press the Verify link or button or use the code to fill into the verification screen

- Now you can log in and see your Dashboard

Installing Windows application

At first download the application from their website, you need to know which Graphics card you have.

Before starting the installer you might have to disable your antivirus as it will block a part of the NiceHash miner.

The windows miner is a standard windows installer, it will also install other programs that are required to run.
Just go through all the steps as you usually do:

Configuration

Mining and configuring the NiceHash miner is pretty easy and only takes a little bit of time. Once the program is installed you can open it but it will require a few easy steps to get ready.

- At first you need to enter a code to confirm you aren't a robot

- Next it will load everything

- Two windows will open, the GUI and a console

- Now you need to assign your wallet (Nicehash account), you can press the button on the bottom or the one on top. Afterwards you'll be prompted to fill in your email (the one you used for your NiceHash account)

- Now you can start mining by clicking the start button

- First time it will benchmark your system and then it will automatically start mining

- It will also open two consoles, these are the miners, one for CPU and one for GPU

- Once it is mining you'll be able to see it in the GUI

- To stop the mining click the stop button

-

Other options

Set worker name

By clicking the worker button you can choose a name for the mining system. This will then show up in the stats to determine which miner is mining what.
This is only useful when you are mining to the same account on multiple systems

Choose mining hardware

You can choose what hardware you want to mine with. You only have the option to enable or disable, there isn't an option to select the intensity or number of cores.
I think this is a very important feature that is missing.

Now you can start mining on the website you can then Withdraw to your wallet or desired exchange.
You can do this by logging in to the NiceHash website and going towards the wallet page, here you can withdraw
